

Biomass Sourcing Criteria

Document name	Puro Biomass Sourcing Criteria
Document version	V0.1
Date of approval	2024-xx-xx, by Puro Scientific Advisory Board
Applicable methodologies	Geologically Stored Carbon, Edition 2024 (pending approval)

Biomass Sourcing Criteria

Document name	Puro Biomass Sourcing Criteria
Document version	V0.1
Date of approval	2024-xx-xx, by Puro Scientific Advisory Board
Applicable methodologies	Geologically Stored Carbon, Edition 2024 (pending approval)

Biomass *can* contribute to climate change mitigation and carbon dioxide removal (CDR), e.g. via its use as biomaterial, bioenergy, but also as a source of biogenic carbon for storage. Despite being a renewable resource, biomass is available in limited amounts and its use for climate change mitigation purpose must not conflict with ecosystem functions and other human needs, primarily food. Biomass also refers to a very wide range of feedstocks, whether from plants or animals, from forestry, agriculture, or recycling – a diversity which leads to numerous opportunities but also risks to manage. Biomass sourcing for human use has been a significant driver of climate change and ecological damage via land use change. Biomass-based technologies are not always guaranteed to deliver improvements, which has led to numerous frameworks and regulations being developed to ensure that human use of biomass and land leads to actual climate, environmental and social benefits.

In this context, Puro's *Biomass Sourcing Criteria* intend to be pragmatic and operational criteria, differentiated for a range of biomass feedstocks, to ensure that biomass sourced for CDR does not lead to unacceptable environmental and social negative impacts. For each biomass feedstock category, the document details required traceability information to be reported, required feedstock sustainability criteria to be evidenced, and options to evidence the sustainability criteria. *Note however that the criteria are only a condition for eligibility of the feedstock and additional rules and exclusions may apply in each applicable methodology (e.g. regarding eligible categories, baseline and leakage).*

The Puro's *Biomass Sourcing Criteria* are built upon an analysis of classification schemes of biomass feedstocks, an analysis of the major potential social and environmental issues associated with biomass sourcing, and reviews of related regulations and voluntary programmes. The criteria also build upon Puro's experience of certifying biomass-based CDR projects across the world. Last, it is important to clarify that these criteria are not a certification scheme for biomass suppliers, but a list of rules that must be met and enforced, and this builds upon other certification programmes and regulations.

The Puro's *Biomass Sourcing Criteria* are meant to be applicable across the Puro Standard and will be refined and extended over time. The latest version of those criteria must always be used when reporting CORCs.

In practice, CO₂ Removal Suppliers must keep records of the biomass processed, alongside all information needed to demonstrate type, origin and sustainability. This information shall then be synthesized as part of the Output Audit procedures. Puro will make templates available to suppliers, to facilitate the reporting of this information.

1. Categories of biomass feedstocks

There are 15 categories of biomass feedstocks (Table 1) distinguished within the Puro Standard. Those categories include multiple types of biomass feedstocks, but these types are of similar nature and require the same type of evidence.

- For the purpose of certification and issuance of CORCs, one biomass feedstock can only belong to one feedstock category, and this category shall be the most directly applicable.
- In case multiple categories would be possible, Puro reserves the right to make a final decision on the classification and update the rules with corresponding clarifications. The categories have however been thought to minimize such situations.

Table 1. Categories of biomass feedstocks and examples

ID	Biomass Feedstock Category	Biomass Feedstock Description
A	Mixed municipal solid waste (MSW)	The non-sorted organic fraction of mixed municipal solid waste (typically used in waste-CCS), from normal municipal waste collection service.
B	Sorted food waste & assimilated	Post-consumer source-separated food waste, post-production food waste, expired food, residues from food processing, other industrial food-related biowaste (e.g. sugar molasses, cooking oils), other farm-level food-related waste (e.g. spoiled food or feed harvest, expired seeds).
C	Sorted MSW fractions, other than food	Post-consumer end-of-life paper, end-of-life textile (natural fibers), end-of-life wood materials (of different grades, e.g. untreated and treated), and assimilated biomaterials, from source-separated waste collection.
D	Green waste	Non-hazardous municipal green waste from urban or rural areas (e.g. park and garden green waste, urban tree cuttings, river debris), including any fraction (e.g. foliage, roots, branches).
E	Animal waste	Abattoir waste and animal manure (typically processed via biological treatment, anaerobic digestion, or fermentation) and its derivatives (e.g. digestate from manure and abattoir waste).
F	Municipal sludge and biosolids	Sewage sludge and biosolids from municipal wastewater treatment.
G	Forest biomass	Forest biomass, including any primary (harvested from forest land) or secondary feedstocks (generated during processing of primary feedstock) such as branches and tops, roots, and stumps, thinning, pruning, bark, woodchips, wood shavings, sawdust, black liquor.
H	Pulp and paper sludge	Pulp and paper mill sludge, derived from processing of virgin fibres, recycled fibres or combination of sources.
I	Non-food agricultural crop	Agricultural crops that are neither food nor feed crop (e.g. energy crops, biomaterial crops), cultivated on agricultural land.
J	Food agricultural crop	Agricultural crops that are food or feed crops, whether used in such applications (e.g. corn or wheat fermented for biofuel, cereals fermented for beverage production), or cultivated on agricultural land.
K	In-field agricultural residues	In-field agricultural residues, originating from the cultivation of a food or feed crop, e.g. cereal straw, rice straw, maize straw, stalks, pruning residues (trees, bushes).
L	Non-field agricultural residues	Non-field agricultural residues, originating from the primary processing of a food crop in a factory, e.g. rice husk, maize cob, nutshell and husk, peels, fruit seeds, bagasse, coffee husk, cocoa pods.
M	Palm oil biomass and derivatives	Any biomass from palm tree plantations (which are not considered forests but agricultural plantations), e.g. palm oil and its fractions, empty fruit bunches, nuts and kernels, cakes, or other side-streams.
N	Conservation landscape management	Invasive species whether on land, in freshwater, or in coastal areas, as well as any biomass from landscape management for conservation purposes of protected areas or assimilated, including forest wildfire mitigation.
O	Aquatic biomass	Cultivated or harvested water-based plants or algae, and associated derivatives.

2. Sourcing criteria

For each feedstock category, the tables below detail i) the required feedstock origin and type disclosures (traceability), ii) the required feedstock sustainability criteria, and iii) options to evidence the sustainability criteria. Feedstock origin and type demonstration are based on disclosure of information and adequate record keeping, including delivery notes, photographic evidence, laboratory analyses, as necessary.

A. Mixed MSW

Feedstock category	Mixed MSW
Feedstock description	The non-sorted organic fraction of mixed municipal solid waste (typically used in waste-CCS), from normal municipal waste collection service
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: - Basic information: identification number, date or range of delivery, amount received - Traceability: geographical area of waste collection, name of entity delivering (e.g. entity performing waste collection) <i>Note: the information provided shall be sufficient to exclude situations where waste is deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability criteria	<i>None, provided that origin and type is demonstrated, and that waste is not deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability evidence options	<i>Not applicable</i>

B. Sorted food waste and assimilated

Feedstock category	Sorted food waste and assimilated
Feedstock description	Post-consumer source-separated food waste, post-production food waste, expired food, residues from food processing, other industrial food-related biowaste (e.g. sugar molasses, cooking oils), other farm-level food-related waste (e.g. spoiled food or feed harvest, expired seeds)
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: - Basic information: identification number, date or range of delivery, amount received - Traceability: geographical area of waste supply, name of entity delivering, name of entity generating the waste if applicable <i>Note: the information provided shall be sufficient to exclude situations where waste is deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability criteria	<i>None, provided that origin and type is demonstrated, and that waste is not deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability evidence options	<i>Not applicable</i>

C. Sorted MSW fractions, other than food

Feedstock category	Sorted MSW fractions, other than food
Feedstock description	Post-consumer end-of-life paper, end-of-life textile (natural fibres), end-of-life wood materials (of different grades, e.g. untreated and treated), and assimilated biomaterials, from source-separated waste collection
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: - Basic information: identification number, date or range of delivery, amount received, material grade (if considered hazardous or not) - Traceability: geographical area of waste supply, name of entity delivering, name of entity generating the waste if applicable <i>Note: the information provided shall be sufficient to exclude situations where waste is deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability criteria	Criteria to be evidenced are: - Adequate management of hazardous waste: if the waste processed is classified as hazardous in the jurisdiction of the project (e.g. chemically treated wood from demolition works), processing of hazardous waste shall be demonstrated to adequately mitigate the associated risks (e.g. air pollutant emissions).
Sustainability evidence options	Criteria can be evidenced by one or a combination of the following options: - Authorisation to process such hazardous waste, delivered by local competent authorities - Regulatory framework in place demonstrating the right of the supplier to process such hazardous waste

D. Green waste

Feedstock category	Green waste
Feedstock description	Non-hazardous municipal green waste from urban or rural areas (e.g. park and garden green waste, urban tree cuttings, river debris), including any fraction (e.g. foliage, roots, branches)
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: - Basic information: identification number, date or range of delivery, amount received - Traceability: geographical area of waste supply, name of entity delivering, name of entity generating the waste if applicable <i>Note: the information provided shall be sufficient to exclude situations where waste is deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability criteria	<i>None, provided that origin and type is demonstrated, and that waste is not deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability evidence options	<i>Not applicable</i>

E. Animal waste

Feedstock category	Animal waste
Feedstock description	Abattoir waste and animal manure (typically processed via biological treatment, anaerobic digestion or fermentation) and its derivatives (e.g. digestate from manure and abattoir waste)
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: - Basic information: identification number, date or range of delivery, amount received - Traceability: geographical area of waste supply, name of entity delivering, name of entity generating the waste if applicable <i>Note: the information provided shall be sufficient to exclude situations where waste is deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability criteria	<i>None, provided that origin and type is demonstrated, and that waste is not deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability evidence options	<i>Not applicable</i>

F. Municipal sludge and biosolids

Feedstock category	Municipal sludge and biosolids
Feedstock	Sewage sludge and biosolids from municipal wastewater treatment
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: - Basic information: identification number, date or range of delivery, amount received. - Traceability: geographical area of waste supply, name of entity delivering, name of entity generating the waste if applicable. <i>Note: the information provided shall be sufficient to exclude situations where waste is deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability criteria	<i>None, provided that origin and type is demonstrated, and that waste is not deliberately produced for the purposes of providing biomass for CDR.</i>
Sustainability evidence options	<i>Not applicable</i>

G. Forest biomass

Feedstock category	Forest biomass
Feedstock description	Forest biomass, including any primary (harvested from forest land) or secondary feedstocks (generated during processing of primary feedstock) such as branches and tops, roots, and stumps, thinnings, prunings, bark, woodchips, wood shavings, sawdust, black liquor.
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: - Basic information: identification number, date or range of delivery, amount received, place of delivery, name of organization delivering (transporter), mode of delivery. - Type and properties: wood form (e.g. sawdust, pellets, chips, liquid), wood type (e.g. species, softwood, hardwood, mix to specify), wood fraction (e.g. branches and tops, needle, bark, stumps), moisture upon delivery or storage, typical carbon content. - Traceability: description of supply-chain, name of intermediaries, country of origin, geographical area of sourcing. Note: the geographical area of sourcing shall be as precise as needed to evidence the sustainability criteria.

Feedstock category	Forest biomass
	<p>- Mix of sources: in case multiple biomass sources are mixed, information must be retained so that a mass-balance approach can be applied to determine the properties of the mix as well as evidence the sustainability criteria, and thereby determine the share of eligible biomass among the mix. Segregation of biomass sources along the supply-chain shall be preferred over mixing, to facilitate traceability and sustainability demonstration.</p>
Sustainability criteria	<p>Criteria to be evidenced are:</p> <ul style="list-style-type: none"> - Legal operations: operators and operations are legal in the jurisdiction of sourcing. - Working conditions: operators have measures in place to ensure safe working conditions during forestry operations. - Replanting: harvested areas are systematically replanted, following local rules or forestry best-practice. - Carbon stocks: forest operations along the entire value chain are contributing to long-term maintenance or increase of carbon stocks in the forest. - Soil quality: forest operations along the entire value chain are designed to contribute to maintenance or improvement of soil quality and structure, e.g. by avoiding harvesting of stumps and roots, avoiding harvesting on vulnerable soils, selection of logging techniques that minimize impact of soil quality and habitats, erosion risks are prevented and controlled, nutrient balance is maintained. - Water resources: forest operations along the entire value chain are designed to preserve water quality and quantity (e.g. reasonable use of chemicals, efficient water use) and not disrupt water flow in the watershed. - Air quality: forest operations shall not resort to <u>uncontrolled</u> wood burning as a means of management. - Biodiversity: forest operations along the entire value chain <u>must ensure</u> (obligation) the protection of designated nature conservation areas and other high-value areas and ensure that clear-cuts are within maximum thresholds defined locally. Further, forest operations <u>should consider</u> (incitation) multiple factors affecting local biodiversity and resilience of the forest stands, e.g. diversity of tree species, diversity of tree ages, protected water flow, deadwood harvesting rates are ecologically appropriate, among others. - Material use: the forest biomass used in a CDR pathway must not be sourced from material suitable for use in long-lived wood products (e.g. sawtimber or veneer), considering environmental, logistic and economic constraints, due to the climate benefit of such long-lived wood products and their constrained availability. - Local needs: in case the biomass sourced is not used locally, it shall be ensured that the sourcing of biomass does not affect essential needs of the local population, with respect to biomass use (e.g. fuel wood for heating) or related resources (e.g. water supply, access to land) - Indigenous populations: in case the biomass is sourced in a region with presence of indigenous populations, sourcing of biomass must not affect the sites and resources that are fundamental for satisfying the basic necessities of local people. - High-value ecosystems: forest biomass must not be sourced from <u>primary forests</u>, <u>highly biodiverse areas</u>, or <u>land recently converted from a high-carbon stock land use</u>, unless otherwise stated. <p><u>Primary forests</u> refer to woodland of native species where there is no clearly visible indication of human activity and the ecological processes are not significantly disturbed; and old growth forest, as defined in the legislation of the country in which the forest is located.</p> <p><u>Highly biodiverse areas</u> refer to both forests and grasslands as identified by the relevant competent authority. Sourcing of biomass may be allowed provided that the harvesting of the biomass does not interfere with those nature protection purposes, and this is validated in-writing by the relevant competent authority.</p> <p><u>High carbon stock previous land use</u> refers to wetlands, peatlands, and natural forests. Land that was in such a state prior to 2008-01-01 and was since then converted to managed forests or plantations is not eligible.</p>
Sustainability evidence options	<p>Criteria can be evidenced by one or a combination of the following options:</p> <ul style="list-style-type: none"> - Certification of the forestry management operations and certification of the chain-of-custody, e.g. via various certification programmes from the Forest Stewardship Council (FSC), the Roundtable on Sustainable Biomaterials (RSB), the Sustainable Biomass Program (SBP), the Sustainable Forestry Initiative (SFI), or the Programme for the Endorsement of Forest Certification (PEFC), among others. - Compliance with relevant regulatory schemes, e.g. EU Renewable Energy Directive (RED) III, other national regulations, or relevant regulation under the UNFCCC (e.g. the Paris Agreement). - Existence and enforcement of local forest management plans, policies, or programs, whether emanating from governmental, regional, or local authorities. This is only applicable in jurisdictions with a Corruption Perception Index (CPI) above or equal to 50. - Primary evidence specific to the sourcing area, compiled by the biomass supplier and verified by a third-party with relevant expertise. The third-party must conduct verifications in line with ISAE 3000 limited assurance engagement or equivalent as a minimum and such verifications shall be updated annually. Note this verification is separate from the Puro Production Facility and Output Audits.

H. Pulp and paper sludge

Feedstock category	Pulp and paper sludge
Feedstock description	Pulp and paper mill sludge, derived from processing of virgin fibres, recycled fibres or combination of sources.

Feedstock category	Pulp and paper sludge
Origin and type evidence	<p>Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received:</p> <ul style="list-style-type: none"> - Basic information: identification number, date or range of delivery, amount received, place of delivery, name of organization delivering (transporter), mode of delivery - Type and properties: sludge fractions or composition (in particular share of virgin fibres in the sludge), moisture upon delivery, typical carbon content - Traceability: description of supply-chain, name of intermediaries up to the factory generating the sludge, country(ies) of origin of virgin materials processed by the factory, geographical area of sourcing of virgin materials processed by the factory. Note: geographical area of sourcing shall be as precise as needed to evidence the sustainability criteria. - Mix of sources: in case multiple biomass sources are mixed, information must be retained so that a mass-balance approach can be applied to determine the properties of the mix as well as evidence the sustainability criteria, and thereby determine the share of eligible biomass among the mix. Segregation of biomass sources along the supply-chain shall be preferred over mixing, to facilitate traceability and sustainability demonstration.
Sustainability criteria	Criteria to be evidenced, only for the share of virgin fibres from forest wood processed by the pulp and paper mill factory, are the same as for Forest biomass (see Table G, above). For the recycled fibre share of pulp and paper sludge no sustainability criteria need to be evidenced.
Sustainability evidence options	The same evidence options apply as for Forest biomass (see Table G, above).

I. Non-food agricultural crop

Feedstock category	Non-food agricultural crop
Feedstock description	Agricultural crops that are neither food nor feed crop (e.g. energy crops, biomaterial crops), cultivated on agricultural land.
Origin and type evidence	<p>Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received:</p> <ul style="list-style-type: none"> - Basic information: identification number, date or range of delivery, amount received, place of delivery, name of organization delivering (transporter), mode of delivery - Type and properties: crop name, crop fraction, moisture upon delivery, typical carbon content - Traceability: description of supply-chain, name of intermediaries, country of origin, geographical area of sourcing. Note: the geographical area of sourcing shall be as precise as needed to evidence the sustainability criteria, and thereby can be required to go up to the agricultural plot or an ensemble of plots. - Mix of sources: in case multiple biomass sources are mixed together, information must be retained so that a mass-balance approach can be applied to determine the properties of the mix as well as evidence the sustainability criteria, and thereby determine the share of eligible biomass among the mix. Segregation of biomass sources along the supply-chain shall be preferred over mixing, to facilitate traceability and sustainability demonstration.
Sustainability criteria	<p>Criteria to be evidenced are:</p> <ul style="list-style-type: none"> - Legal operations: operators and operations are legal in the jurisdiction of sourcing. - Working conditions: operators have measures in place to ensure safe working conditions during cultivation and harvesting of the crop. - High-value ecosystems or high-carbon stock land areas: cultivation operations must not take place on land that is or used to be <u>highly biodiverse areas</u>, or <u>high-carbon stock land areas</u>, prior to 2008-01-01. Only land that was already agricultural land prior to this date may be used to source agricultural crops for CDR. <u>Highly biodiverse areas</u> refer to both forests and grasslands as identified by the relevant competent authority. <u>High carbon stock previous areas</u> refer to wetlands, peatlands, and forests. - Carbon stocks: agricultural crop cultivation is planned to contribute to long-term maintenance or increase of carbon stocks in cultivated areas. - Competition for food or feed: <ol style="list-style-type: none"> 1. Cultivation of agricultural crop for CDR is allowed on degraded, marginal, or contaminated land, without significant concerns of competition for food or feed production. Classification as degraded, marginal, or contaminated land shall be recognized by local competent authorities. 2. For any other type of agricultural land, it is assumed that such land can be used for food or feed production, and in that case, the cultivation of agricultural crops for CDR is allowed only if the CDR crop is a <u>cover crop</u>, an <u>intermediary crop</u>, or a crop cultivated as part of an <u>agricultural rotation</u> where it represents less than 30% of the rotation (the rest being meant for food or feed purposes). 3. An exception to rule 2. is made for CDR pathways whose <u>main product</u> is a food or feed commodity. 4. An exception to rule 2. is made for agricultural land that has been repeatedly cultivated for bioenergy crops for more than 20 years prior to the start of the CDR activity (i.e. typical of retrofitting of existing 1st-generation biofuel refineries). - Environmentally sound agriculture: <ol style="list-style-type: none"> 1. New establishment of agricultural crop cultivation for CDR, starting after 2020-12-31, must follow national guidelines for sound agricultural practices or other best-practice recommendations, with respect to preservation of soil quality, efficient water use, protection of water resources, reasonable use of fertilizers and chemicals, and biodiversity measures.

Feedstock category	Non-food agricultural crop
	<p>2. Existing agricultural crop cultivation for bioenergy or other purposes, prior to 2020-12-31, retrofitted for CDR purposes, are recommended to implement such measures, but are not required to evidence it, yet.</p> <ul style="list-style-type: none"> - Indigenous populations: in case the biomass is sourced in a region with presence of indigenous populations, sourcing of biomass must not affect the sites and resources that are fundamental for satisfying the basic necessities of local people.
Sustainability evidence options	<p>Criteria can be evidenced by one or a combination of the following options:</p> <ul style="list-style-type: none"> - Certification of agricultural practice - Compliance with relevant regulatory schemes, e.g. EU Renewable Energy Directive (RED) III, other national regulations, or relevant regulation under the UNFCCC (e.g. the Paris Agreement) - Existence and enforcement of local agricultural plans, policies, programs, laws, or regulation, whether emanating from governmental, regional, or local authorities. - Primary evidence from the biomass supplier, for the criteria Legal operations, Working conditions, Carbon stocks, Indigenous populations, Environmentally sound agriculture - Land use maps, official land register extracts, or other official documentation, specifically to demonstrate eligibility of the agricultural land use with respect to the criteria of non-conversion of high-value ecosystems and non-competition for food or feed.

J. Food agricultural crop

Feedstock category	Food agricultural crop
Feedstock description	Agricultural crops that are food or feed crops, whether used in such applications or not (e.g. corn or wheat fermented for biofuel, cereals fermented for beverage production), cultivated on agricultural land.
Origin and type evidence	The same criteria apply as for Non-food agricultural crop (see Table I, above).
Sustainability criteria	The same criteria apply as for Non-food agricultural crop (see Table I, above).
Sustainability evidence options	The same evidence options apply as for Non-food agricultural crop (see Table I, above).

K. In-field agricultural residues

Feedstock category	In-field agricultural residues
Feedstock description	In-field agricultural residues, originating from the cultivation of a food or feed crop, e.g. cereal straw, rice straw, maize straw, stalks, pruning residues (trees, bushes).
Origin and type evidence	<p>Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received:</p> <ul style="list-style-type: none"> - Basic information: identification number, date or range of delivery, amount received, place of delivery, name of organization delivering (transporter), mode of delivery - Type and properties: crop name, crop fraction, moisture upon delivery, typical carbon content - Traceability: description of supply-chain, name of intermediaries, country of origin, geographical area of sourcing. Note: the geographical area of sourcing shall be as precise as needed to evidence the sustainability criteria, and thereby can be required to go up to the agricultural plot or an ensemble of plots. - Mix of sources: in case multiple biomass sources are mixed together, information must be retained so that a mass-balance approach can be applied to determine the properties of the mix as well as evidence the sustainability criteria, and thereby determine the share of eligible biomass among the mix. Segregation of biomass sources along the supply-chain shall be preferred over mixing, to facilitate traceability and sustainability demonstration.
Sustainability criteria	<p>Criteria to be evidenced are:</p> <ul style="list-style-type: none"> - Soil quality and carbon stocks: harvesting of residues is performed in a manner that preserves soil quality and carbon stocks, e.g. using methods that leave a significant share of residues to decompose in the soil (e.g. roots left in place, adjusted cutting height), or following any existing local or national regulation on residue harvesting. - Working conditions: operators have measures in place to ensure safe working conditions during cultivation and harvesting of the residues.
Sustainability evidence options	<p>Criteria can be evidenced by one or a combination of the following options:</p> <ul style="list-style-type: none"> - Primary evidence from the biomass supplier, for the criteria Working conditions and Soil quality and carbon stocks, detailing the measures in place - Existence and enforcement of local residue harvesting plans, policies, programs, regulations, or laws, whether emanating from governmental, regional or local authorities, tackling soil quality and carbon stocks, including some level of monitoring

L. Non-field agricultural residues

Feedstock category	Non-field agricultural residues
Feedstock description	Non-field agricultural residues, originating from the primary processing of a food crop in a factory, e.g., rice husk, maize cob, nutshell and husk, peels, fruit seeds, bagasse, coffee husk, cocoa pods.
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: <ul style="list-style-type: none"> - Basic information: identification number, date or range of delivery, amount received, place of delivery, name of organization delivering (transporter), mode of delivery - Type and properties: crop name, crop fraction, moisture upon delivery, typical carbon content - Traceability: description of supply-chain, name of intermediaries up to the factory generating the residue, country(ies) of origin of the crop, geographical area(s) of cultivation of the crop. - Mix of sources: in case multiple biomass sources are mixed together, information must be retained so that a mass-balance approach can be applied to determine the properties of the mix as well as evidence the sustainability criteria, and thereby determine the share of eligible biomass among the mix. Segregation of biomass sources along the supply-chain shall be preferred over mixing, to facilitate traceability and sustainability demonstration.
Sustainability criteria	Criteria to be evidenced are: <ul style="list-style-type: none"> - Legal operations: operators and operations are legal in the jurisdiction of sourcing. - Working conditions: operators have measures in place to ensure safe working conditions during processing of the residues.
Sustainability evidence options	Criteria can be evidenced by one or a combination of the following options: <ul style="list-style-type: none"> - Primary evidence from the biomass supplier, for the criteria Legal operations and Working conditions.

M. Palm oil biomass and derivatives

Feedstock category	Palm oil biomass and derivatives
Feedstock description	Any biomass from palm tree plantations (which are not considered forests but agricultural plantations), e.g. palm oil and its fractions, empty fruit bunches (EFB), nuts and kernels, cakes, or other side-streams.
Origin and type evidence	Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received: <ul style="list-style-type: none"> - Basic information: identification number, date or range of delivery, amount received, place of delivery, name of organization delivering (transporter), mode of delivery - Type and properties: crop name, crop fraction, moisture upon delivery, typical carbon content - Traceability, for fractions derived from processing palm fruit: description of supply-chain, name of intermediaries, country of origin, name and location of processing factory, list of all plots of land from which palm fruits were sourced for this factory. - Traceability, for fractions derived from palm cultivation operations (e.g. tree trunks at end of cultivation cycle): description of supply-chain, name of intermediaries, country of origin, list of all plots of land from which biomass was sourced. - Mix of sources: in case multiple biomass sources are mixed, information must be retained so that a mass-balance approach can be applied to determine the properties of the mix as well as evidence the sustainability criteria, and thereby determine the share of eligible biomass among the mix. Segregation of biomass sources along the supply-chain shall be preferred over mixing, to facilitate traceability and sustainability demonstration.
Sustainability criteria	Criteria to be evidenced are: <ul style="list-style-type: none"> - Legal operations: operators and operations are legal in the jurisdiction of sourcing. - Working conditions: operators have measures in place to ensure safe working conditions during cultivation operations. - Carbon stocks: cultivation operations along the entire value chain are contributing to long-term maintenance or increase of carbon stocks in the area of the plantations. - Soil quality: cultivation operations along the entire value chain are designed to contribute to maintenance or improvement of soil quality and structure. - Water resources: cultivation operations along the entire value chain are designed to preserve water quality and quantity (e.g. reasonable use of chemicals, efficient water use) - Air quality: forest operations shall not resort to uncontrolled wood burning as a means of management. - Biodiversity: cultivation operations along the entire value chain <u>must ensure</u> the protection of designated nature conservation areas and other high-value areas. Further, cultivation operations <u>should consider</u> multiple factors affecting local biodiversity and resilience of the ecosystem, e.g. wildlife habitat and corridors, water flows, among others. - Indigenous populations: in case the biomass is sourced in a region with presence of indigenous populations, sourcing of biomass must not affect the sites and resources that are fundamental for satisfying the basic necessities of local people.

Feedstock category	Palm oil biomass and derivatives
	<p>- High-value ecosystems: biomass from palm plantations must not be sourced from <u>primary forests</u>, <u>highly biodiverse areas</u>, or <u>land recently converted from a high-carbon stock land use</u>.</p> <p><u>Primary forests</u> refer to woodland of native species where there is no clearly visible indication of human activity and the ecological processes are not significantly disturbed; and old growth forest, as defined in the legislation of the country in which the forest is located.</p> <p><u>Highly biodiverse areas</u> refer to both forests and grasslands as identified by the relevant competent authority.</p> <p><u>High carbon stock previous land use</u> refers to wetlands, peatlands, and primary forests. Land that was in such a state prior to 2008-12-31 and was since then converted to palm plantations is not eligible.</p>
Sustainability evidence options	<p>Criteria can be evidenced by one or a combination of the following options:</p> <ul style="list-style-type: none"> - Certification of the palm agricultural plantation for its management and chain-of-custody, e.g. via various nationally recognised certification programmes. - Compliance with relevant regulatory schemes, e.g. EU Renewable Energy Directive (RED) III, EU Deforestation-free- products (EU DR), relevant regulation under the UNFCCC (e.g. the Paris Agreement), or other national regulations, - Primary evidence specific to the sourcing area, compiled by the biomass supplier and verified by a third-party with relevant expertise. The third-party must conduct verifications in line with ISAE 3000 limited assurance engagement or equivalent as a minimum and such verifications shall be updated annually. Note this verification is separate from the Puro Production Facility and Output Audits. - Land use maps, specifically to demonstrate eligibility of the plantations with respect to the criteria of non-conversion of high-value ecosystems to plantations, in combination with traceability evidence.

N. Conservation landscape management

Feedstock category	Conservation landscape management
Feedstock description	Invasive species whether on land, in freshwater, or in coastal areas, as well as any biomass from landscape management for conservation purposes of protected areas or assimilated, including forest wildfire mitigation.
Origin and type evidence	<p>Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received:</p> <ul style="list-style-type: none"> - Basic information: identification number, date or range of delivery, amount received, place of delivery, name of organization delivering (transporter), mode of delivery - Type and properties: plant name, plant fraction, moisture upon delivery, typical carbon content - Traceability: description of supply-chain, name of intermediaries, country of origin, geographical area of sourcing up to the actual plots of land or coast. - Mix of sources: in case multiple biomass sources are mixed together, information must be retained so that a mass-balance approach can be applied to determine the properties of the mix as well as evidence the sustainability criteria, and thereby determine the share of eligible biomass among the mix. Segregation of biomass sources along the supply-chain shall be preferred over mixing, to facilitate traceability and sustainability demonstration.
Sustainability criteria	<p>Criteria to be evidenced are:</p> <ul style="list-style-type: none"> - Legal operations: operators and operations are legal in the jurisdiction of sourcing. - Working conditions: operators have measures in place to ensure safe working conditions during harvesting or collection operations. - Environmental conditions: the operators have developed or follow an existing harvesting/collection plan that ensures that only adequate species are harvested/collected, and in a suitable manner with respect to both quantities and methods used. This plan must have been approved by relevant competent authorities in the jurisdiction of sourcing.
Sustainability evidence options	<p>Criteria can be evidenced by one or a combination of the following options:</p> <ul style="list-style-type: none"> - Primary evidence from the biomass supplier, for the criteria Legal operations and Working conditions. - Primary evidence specific to the sourcing area, compiled by the biomass supplier, for the criteria Environmental conditions, including official documents from relevant competent authorities.

O. Aquatic biomass

Feedstock category	Aquatic biomass
Feedstock description	Cultivated or harvested water-based plants or algae, and associated derivatives.

Feedstock category	Aquatic biomass
Origin and type evidence	<p>Origin and type of the feedstock shall be specified as follow, for each feedstock delivery received:</p> <ul style="list-style-type: none"> - Basic information: identification number, date or range of delivery, amount received, place of delivery, name of organization delivering (transporter), mode of delivery - Type and properties: plant name, plant fraction, moisture upon delivery, typical carbon content - Traceability: description of supply-chain, name of intermediaries, country of origin, geographical area of sourcing up to the actual plots of land or coast. - Mix of sources: in case multiple biomass sources are mixed together, information must be retained so that a mass-balance approach can be applied to determine the properties of the mix as well as evidence the sustainability criteria, and thereby determine the share of eligible biomass among the mix. Segregation of biomass sources along the supply-chain shall be preferred over mixing, to facilitate traceability and sustainability demonstration.
Sustainability criteria	<p>Criteria to be evidenced are:</p> <ul style="list-style-type: none"> - Legal operations: operators and operations are legal in the jurisdiction of sourcing. - Working conditions: operators have measures in place to ensure safe working conditions during harvesting or collection operations. <p><i>Further requirements on the production process of water-based plants or algae may be added in the future, e.g. relating to water quality, use of chemicals, and competition for other.</i></p>
Sustainability evidence options	<p>Criteria can be evidenced by one or a combination of the following options:</p> <ul style="list-style-type: none"> - Primary evidence from the biomass supplier, for the criteria Legal operations and Working conditions.

3. Definitions and clarifications

3.1. Definitions

The following definitions are used in the above-listed criteria:

Primary forests refer to woodland of native tree species where there is no clearly visible indication of human activity and the ecological processes are not significantly disturbed; and old growth forest, as defined in the legislation of the country in which the forest is located. *The definition is adapted from EU regulation (2023/1115).*

Wetlands refer to areas of marsh, fen, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed six metres. Wetlands include a wide variety of inland habitats such as marshes, wet grasslands and peatlands, floodplains, rivers and lakes, and coastal areas such as saltmarshes, mangroves, intertidal mudflats and seagrass beds, and coral reefs and other marine areas no deeper than six meters at low tide. It may also include human-made wetlands such as dams or reservoirs, if specific valuable ecological features have developed in those built wetlands. *The definition is adapted from the Ramsar Convention on Wetlands (2016).*

Peatlands refer to a special type of wetland dominated by peat-forming plants such as Sphagnum mosses, where biomass does not completely decompose due to anoxic conditions and nearly permanent water saturation. *The definition is adapted from the EU Biodiversity Information System for Europe.*

High carbon stock areas refer jointly to wetlands, peatlands, primary forests, and natural forests.

Highly biodiverse areas refer to both forests and grasslands as identified by the relevant competent authority as being highly valuable from the perspective of biodiversity preservation.

3.2. Clarifications

The following clarifications are made about concepts used in the above-listed criteria:

Traceability and Chain of custody

A key aspect to determine the eligibility of the biomass for the carbon dioxide removal activities covered by the Geologically Stored Carbon lies in providing evidence on its origin, which affects also how sustainability criteria can be evidenced. To that end, we provide additional contextual information based on ISEAL's *Chain of custody models and definitions* (2016) as follows:

- i. **Chain of custody (CoC):** “the custodial sequence that occurs as ownership or control of the material supply is transferred from one custodian to another in the supply chain.” There are several approaches or models taken to demonstrate the physical or administrative link between the verified unit of production and the final product claim. For the purposes of the Puro Biomass Sourcing Criteria, the focus is on *segregation* and *mass-balance* approaches.
- ii. **Traceability:** “The ability to verify the history, location, or application of an item by means of documented recorded identification.”
- iii. **Segregation CoC approach:** in this case, certified material is physically kept separate from non-certified material of the same commodity through all stages of the supply chain.

This only allows mixing of certified materials from different sources. The exact origin/producer information remains available throughout the chain of traceability system.

- iv. **Mass-balance CoC approach:** in this case, certified material may be mixed with non-certified material provided that the quantities associated with certified claims are controlled. For this methodology, only batch-level mass balance is allowed. This requires that certified and non-certified materials remain segregated until the point of mixing, and the proportion or percentage of each component be recorded appropriately. This will allow the proper accounting of the certified material towards the eligible carbon source.

Cut-off dates for land use conversion or management practices

For certain feedstock categories (e.g. forest biomass, agricultural crop), cut-off dates for land use conversion and management practices are used, to specify when certain rules are applicable. Two such dates are used, for different purposes and rationales:

- 2008-01-01, similar to the cut-off date available in EU RED II and RED III
- 2020-12-31, similar to the cut-off date available in EU Regulation on Deforestation-free products

Land use conversion from high carbon stock areas must not have taken after 2008-01-01, in order for resulting biomass to be eligible. This is in line with currently enforced EU RED III, as well as conservative for the time being. It should be noted that the EU Regulation on Deforestation-free products, uses a different cut-off year, specifically for deforestation and forest degradation, but that this regulation is still in its early stage of implementation.

Agricultural land management practices, for purpose grown biomass, the second cut-off date is used (2020-12-31) to require that any new establishment of purpose grown biomass for CDR on eligible agricultural land follows stricter rules with respect to important environmental factors in agriculture. This is perceived as a necessary condition to ensure a safe and sound scaling of CDR with new establishment of biomass cultivation.
